The *CrawlProof* Framework

AUDIT YOUR *AI Crawlability*

PRIORITY #1

See what AI crawlers *actually* find.

Here is what wins AI visibility:

- **Do not guess:** *"Our homepage looks fine in a browser."*
- **Instead verify:** *"Answer engines can access the content, schema, and positioning we want them to cite."*

● CrawlProof audits what LLM crawlers and answer engines can actually see.

Key Takeaway:

AI visibility starts with discoverability. If the crawler cannot see it, the answer engine cannot use it.

CrawlProof check: content visibility, schema, robots rules, AI-bot access, and positioning clarity.

PRIORITY #2

Remove blockers before they *hide your brand.*

Your audit should answer:

- Are robots rules blocking important AI crawlers?
- Are sitemaps complete and reachable?
- Do broken links or slow fetches waste crawler attention?
- Does JavaScript hide critical copy from HTML-only crawlers?

Key Takeaway:

AEO is not just content. It is access, crawl paths, renderability, and clean technical signals.

CrawlProof check: raw HTML vs. JS-rendered diff, sitemap coverage, robots rules, fetch-time, and broken links.

PRIORITY #3

Make your pages *machine-readable*.

Structured data turns pages into signals:

- Validate JSON-LD before answer engines judge it.
- Mark up Organization, Product, FAQ, Article, and Breadcrumb content.
- Keep schema aligned with what users actually see on-page.

● CrawlProof flags the missing and invalid schema that weakens AI understanding.

Key Takeaway:

Clear schema gives answer engines the context they need to understand who you are and what you offer.

CrawlProof check: JSON-LD presence and validity across common business and content schema types.

OPTIMIZE *Answer-Engine* SIGNALS

PRIORITY #4

Control AI-bot access *intentionally.*

**Do not leave crawler policy accidental:**

- Know whether GPTBot, ClaudeBot, PerplexityBot, OAI-SearchBot, and others can read you.
- Flag robots rules that block or fail to address key AI crawlers.
- Align access rules with your growth strategy and risk posture.

Key Takeaway:

AI crawler access should be a deliberate business decision, not a forgotten robots.txt side effect.

CrawlProof check: major AI crawler directives, including GPTBot, ClaudeBot, PerplexityBot, Google-Extended, OAI-SearchBot, Applebot-Extended, and CCBot.

PRIORITY #5

Add *llms.txt* and *skill.md*.

**New AI-readable files deserve a plan:**

- Use llms.txt to guide AI systems toward the right content.
- Use skill.md to explain how AI agents should interact with your site.
- Keep both files short, clear, and aligned with your brand positioning.

Key Takeaway:

Give AI systems a clean map instead of forcing them to infer your site from scattered pages.

● CrawlProof checks whether both files exist and tells you what to put in them.

CrawlProof check: llms.txt and skill.md presence, clarity, and recommended content.

TURN FINDINGS *Into Action*

PRIORITY #6

Clarify positioning for *answer engines*.

Your homepage should answer fast:

- What do you do?
- Who is it for?
- What problem do you solve?
- Where are pricing, contact, team, and proof points?

● CrawlProof checks H1, value prop, pricing, contact, team, and positioning clarity.

Key Takeaway:

If your positioning is vague to humans, it is usually vague to AI systems too.

CrawlProof check: whether the page clearly communicates what the company does and why it matters.

PRIORITY #7

Prioritize fixes your team can ship.

AEO improvements should not die in a spreadsheet:

- Rank every issue by impact and urgency.
- Turn findings into instructions your dev team can use.
- Hand fixes to a human developer or an LLM with clear context.

**Key Takeaway:**

The best audit is not the biggest report. It is the shortest path to a visible fix.

CrawlProof output: every finding ranked 1-5 with copy you can hand straight to your developer or LLM.

PRIORITY #8

Track AEO score *week over week.*

Measure the system, not just a single page:

- Save important URLs as projects.
- Track AEO score, finding mix, section health, and backlog.
- Use re-audits to prove technical and content improvements are working.

**Key Takeaway:**

AI visibility is a moving target. Track it continuously so small issues do not become invisible losses.

CrawlProof dashboard: re-audit history, AEO score, finding mix, section health, and priority backlog.

PRIORITY #9

Use scans as a *growth loop*.

Do not treat AEO as a one-time cleanup:

- Audit your highest-value pages first.
- Ship priority fixes.
- Re-audit and compare the score.
- Repeat across products, landing pages, and content hubs.

Key Takeaway:

Every re-audit compounds your site into a cleaner, more discoverable source for AI systems.

Simple rollout: scan → prioritize → fix → re-scan → expand to the next page or site.

The CrawlProof *AI Visibility Checklist*

- ✓ Can AI crawlers read the page?
- ✓ Do raw HTML and rendered content reveal the same value?
- ✓ Is robots.txt blocking key AI bots?
- ✓ Is the sitemap complete and reachable?
- ✓ Is JSON-LD present, valid, and aligned to the page?
- ✓ Do you have llms.txt and skill.md?
- ✓ Is the value prop clear in H1 and hero copy?
- ✓ Are fixes ranked by priority and ready to hand off?
- ✓ Are you tracking AEO score across re-audits?

If you can answer all 9, your site is ready for AI discovery.

Ready to see your site the way *AI crawlers* do?

CrawlProof runs an AEO audit on any URL and turns crawlability, schema, robots, AI-bot access, and positioning issues into a prioritized fix list.

What you get: free rule-based audit, on-page report, optional PDF delivery, and a clear backlog of fixes your team can ship.
